The AI Language LISP

- LISP - LIST Processing Invented in the late 50's by John McCarthy at MIT on an IBM 704 computer.
- LISP is about symbolic processing, i.e., symbol manipulation is treating the binary quantities inside the computer like the words and sentences of a language. The words in LISP are called *atoms*. The sentences are called *lists*. Collectively atoms and lists are called *symbolic expressions* (*s-expressions*) or *SEX* for short.
- Examples:
 - (arroyo (professor ece
(degree phd
(area (ce robotics)))
 - (trip (gainesville tallahassee 150)
(tallahassee perry 50)
(perry gainesville 100))

The AI Language LISP

Subjugator 2006

- Uses of LISP
 - > Expert Problem Solvers
 - > Commonsense Reasoning
 - > Learning
 - > Natural Language Interfaces
 - > Education and Intelligent Support Systems
 - > Speech and Vision
 - > The premier symbolic processing language is Common LISP
- Myths
 - > LISP is slow
 - > LISP programs are big
 - > LISP is hard to learn
 - > LISP is hard to debug & read because all those parentheses

Subjugator 2006

- Tutorial Introduction to LISP
 - > XLISP is available from stat.umn.edu by David Betz & Luke Tierney
 - > We have the latest 16-bit & 32-bit version on www.mil.ufl.edu/eel5840
 - > Install using winzip, pkunzip or in a fresh directory by running the self-extracting file.
 - > Go to the XLISP-STAT resources link to obtain additional information including a manual, the UNIX version and the MAC version.

LISP Lab 1

Subjugator 2006

Predicate Functions:

<i>(atom sex)</i>	t if sex is an atom
<i>(null sex)</i>	t if sex is nil or ()
<i>(eq sex1 sex2)</i>	t if sex1==sex2 (identical)
<i>(equal sex1 sex2)</i>	t if sex1=sex2
<i>(zerop sex1)</i>	t if sex=0
<i>(numberp sex)</i>	t if sex is a number
<i>(symbolp sex)</i>	t if sex is a symbolic atom
<i>(listp sex)</i>	t if sex is a list
<i>(member sex lis)</i>	nil if sex is not a member of lis

LISP Lab 1

Subjugator 2006

LIST Functions:

<i>(car lis)</i>	returns the 1st sex of list "lis", same as <i>first</i>
<i>(cdr lis)</i>	returns the list "lis" with the 1 st sex removed, same as <i>rest</i>
<i>(car (cdr lis))</i>	same as <i>second</i> , i.e., 2 nd sex of the list "lis"
<i>(list sex1 sex2)</i>	returns the list (sex1 sex2)
<i>(cons sex1 lis)</i>	makes sex1 the 1 st element of the list "lis"
<i>(append lis1 lis2)</i>	a new list with all the elements of lis1 followed by all the elements of lis2

(defun fname (argument-list) <(forms)>)

(pprint (function-lambda-expression #'fname))

LISP Lab 2

Subjugator 2006

Predicate Functions:

<i>(integerp sex)</i>	t if sex is an integer
<i>(floatp sex)</i>	t if sex is a floating point number
<i>(and sex1 sex2)</i>	t if sex1 and sex2 are both true
<i>(or sex1 sex2)</i>	t if sex1 or sex2 or both are true
<i>(not pred)</i>	nil if pred=t or non-nil, t if pred=nil

User-Defined Functions:

(cond <(clause₁) >...<(clause_n) >) returns the evaluated action from the 1st non-nil predicate or nil where (clause_i) ⇒ (predicate-form action-form)

(defun fname (argument-list) <(forms)>)

(pprint (function-lambda-expression #'fname))
